

In today's CC, you need to build a quiz application.

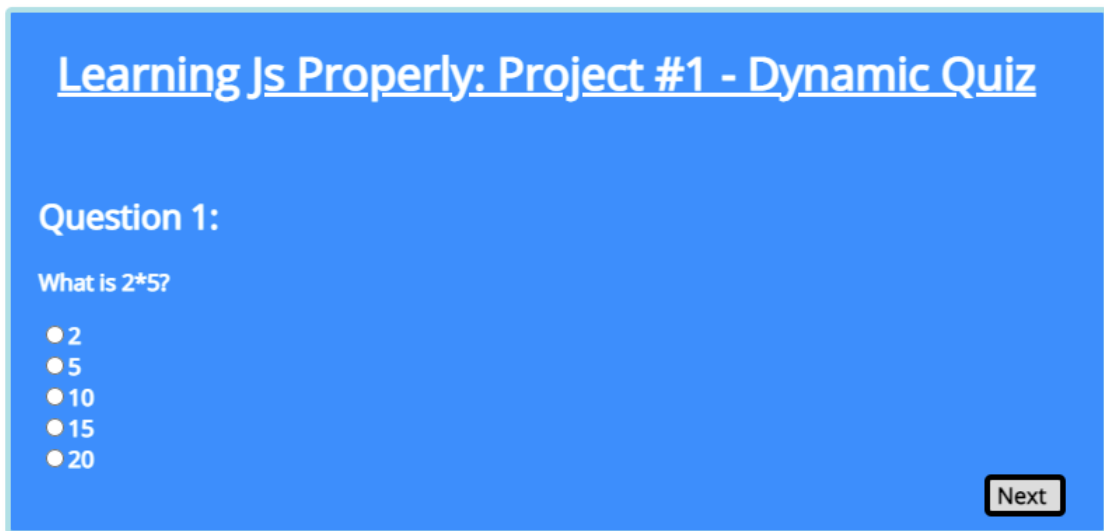

You need to use the [Open Trivia API](#) to get random questions from the server and use those questions to show in your UI dynamically. This API does not require any access_key so you don't need to create any account.

In the above API you'll have to generate a URL using your choices of category, difficulty etc, and then call/use that URL in your project.

The user will always see one question at a time. Do **NOT** display more than one question at a time.

The user should be able to navigate between all the questions using any means you provide.

After user answers all your questions you need to show how many questions were right and wrong accordingly.

Note:

- No embedded JavaScript. Your JavaScript code should be written in a .js file and should be linked accordingly.
- You can design the UI in any way you like.
- Also focus on code readability and proper approach along with usage of ES6 and modules wherever possible.
