

Q1) Using React and Redux, create a simple todo list app. Have an input and a button. When the user clicks on the button, the value inside the input field gets added to the ul or ol list tag.

You do not need to figure out removing/editing a todo item. Only the basic functionality of adding to the todo list needs to be working.

Note

- Style the UI as per your desire.
- Use of Redux and its pattern is mandatory.
- Have the todo list as one component and the input and getting the todo text from the user in another component.
