Q1) Make a React-Redux application in which you have to make:

1. Route for products (/products)

2. Get listing of the products from https://fakestoreapi.com/products and display the listing in the form of cards.

In order to fetch from the API, call the API when the component is mounted, and then dispatch the action to update the store.

**Note**

- Style the UI as per your desire.
- Use of Redux and its pattern is mandatory, use action creators rather than plain action objects

**Marking Scheme**

[Correct Code Execution: 10, Correct Approach: 3, Code Readability: 2]
