In today's CC, you need to design two models which will have a relationship of "One to Many".

The first model is **Customer** which has property called **name & cars.**

The second model is **Cars** which has property called **model, price, & customer**

As expected, we can understand the relationship between the two model as such:

- A customer can have multiple cars.
- A car can only have one customer (which will be the owner)

You need to write a script file in node.js which will add **2 Customers** having **3 & 4** cars respectively.

Then, display the following results in the console:

1. Get a list of all the cars of customer 2 (should display 4 cars)
2. Get a list of all the customers along with their cars in the **cars** property of **Customer** model.
