In today's CC, the task is to design the layout as shown below using flexbox.

We call this layout as the "Holy Grail" layout. This is the most common layout used for making webpages.

You will need to use multiple flexboxes to achieve the above layout. Use semantic tags for different areas of the layout as shown above.

Note:

- No internal/inline stylesheets.
- The layout is more important than the content inside it in this CC. However, you can go ahead and add more content/CSS to webpage.
